 >1 <2.3: **0 (0.00%)**
 >2.3: **0 (0.00%)**

Volumetric x,y,Y view where measured points with corresponding dE2000 value below 1.0 are shown as green dots. All 4,913 measured patches were below 1.0. If any points were higher than dE2000 of 1.0 they would be shown as orange or red instead of green.

All graphs represent actual measured data of a DM220 calibrated with a CR100 using Direct Connect Volumetric AutoCal. The AutoCal process took an elapsed time of under 7 minutes. Results shown here were obtained with a 4,913pt Cube Based Analysis in LightIllusion's ColourSpace using the same CR100 that was used for AutoCal. This comparison illustrates the performance of the Rec709, 6500K, gamma 2.4 selection vs. a Rec709, 6500K, gamma 2.4 target, but other gamut, CCT, and EOTF selections may be made from the monitor's menu without requiring recalibration of the display.
